UN Women and Pardee Center for International Futures. 2025. <u>International Futures modelling platform</u> v.8.45. The forecasts for poverty are initialized in 2020, and the increase observed in NAWA's poverty rates after that point aligns with regional macroeconomic projections. Looking at GDP growth and GDP per capita (PPP) trajectories, several NAWA countries experienced significant economic contractions or volatility around 2020–2025. For instance, countries like Lebanon, Syria, and particularly Sudan shows sharp drops or erratic growth patterns in the immediate post-2020 period. These economic patterns feed into the poverty forecast.

Following the release of new purchasing power parities in May 2024, the World Bank <u>updated the international</u> <u>poverty line to \$3.00 per person per day in June 2025</u>. This replaces the previous \$2.15 poverty line based on 2017 PPPs. Data from International Futures modelling platform does not incorporate this change and measures poverty based on the \$2.15 poverty line.

Note: Reviewing the First Progress Report on the Action Targets of the National Digital Development Plan (PNDT) 2022–2027, which is the most recent report available and corresponds to the year 2023, the ICT training program for people over 40 years old is already underway and has shown concrete progress, although it has not yet fully met the targets set for the analyzed period. As of the first four months of 2023, 507 people have been trained, representing just over 50% of the annual goal of 1,000. Importantly, 65% of the beneficiaries are women, fulfilling the plan's gender focus. While progress has been slower than initially expected, those responsible view the results positively and expect the target to be met.

Paragraph 2:

Sentence 1: UN Women and Pardee Institute for International Futures. 2025. International Futures Modelling Platform. Notes: The calculation of the number of women beneficiaries is derived from a variable that looks at the connections for fixed and mobile broadband per 100 people. To get to the estimate for fixed broadband connections, the additional connections per 100 are multiplied by the female population per 100. The total number of female beneficiaries is then obtained by multiplying the additional connections by 0.25* average household size per region to account for sex and age. For mobile broadband, the additional connections per 100 are simply multipled by per 100 female population. These calculations should be interpreted with caution as the focus is on connections per population rather than on Internet users; fixed subscriptions will also be associated with non-households (businesses, etc.).
