

KEY LEVERS TO CATALYSE A GREEN AND GENDER EQUITABLE RECOVERY

FINANCING:

Invest in gender-responsive policies to mitigate and adapt to climate change and environmental degradation.

Those countries with the largest historical responsibility for emissions should bear most of the burden of supporting poorer countries to transition to environmental sustainability, with financing taking account of gender-specific risks and vulnerabilities.

Governments must support civil society organisations to lead sustainable approaches that privilege local ecosystems, Indigenous knowledge and women's leadership.

ACCOUNTABILITY

to ensure social and gender goals are prioritized in environmental policies.

Gender-just transitions can only be achieved through transparent and accountable processes, which calls for support for women's organizations to ensure they can participate meaningfully, as well as robust measures to protect women human rights defenders.

Addressing data and evidence gaps will be essential to support gender-just transitions, requiring new conceptual and methodological work and enhanced data collection and gender analysis, including on environmental policymaking.

PARTNERSHIPS

to empower local communities for gender-just transitions in energy and agriculture.

Developing new **DATA** on the gender environment nexus.

Ensuring gender-just transitions to build economies that support the flourishing and survival of people and planet.
